

Particulate Stain Response Grass and Mud

The level of wash performance shown by natural stains supplied by Warwick Equest, was evaluated by performing a series of wash tests under European conditions using both commercial powder and liquid detergents. A clean ballast load has been used to show optimum levels of stain removal.

Results shown below are for 5cm stain circles, prepared on 100% knitted cotton, white fabric.

Wash Conditions:

- European Machine – Miele W487
- 40°C wash programme (104°F)
- Normal wash, cotton cycle
- 3.5Kg clean ballast load
- 10g/l detergent dose for powder formulation, 7.5g/l detergent dose for liquid formulation

As detergent dose is increased, the level of stain removal also increases. The level of detergent required to deliver maximum stain removal varies by stain type.
