

Protease Response Spinach/Grass Stains

The level of protease enzyme response shown by natural stains supplied by Warwick Equest, was evaluated by performing a series of wash tests under European conditions using both commercial powder and liquid detergents. A clean ballast load has been used to show optimum levels of stain removal.

Results shown below are for 5cm stain circles, prepared on 100% knitted cotton, white fabric.

Wash Conditions:

- European Machine – Miele W487
- 40°C wash programme (104°F)
- Normal wash, cotton cycle
- 3.5Kg clean ballast load
- 10g/l detergent dose for powder formulation, 7.5g/l detergent dose for liquid formulation

As protease enzyme dose is increased, the level of stain removal also increases. The level of enzyme required to deliver maximum stain removal varies by stain type.
